ORIGINAL ARTICLE

Prenatal screening for fetal aneuploidies with cell-free DNA in the general pregnancy population: a cost-effectiveness analysis

Genevieve Fairbrother[1], John Burigo[2], Thomas Sharon[1], and Ken Song[3]

"As NIPT identifies more fetal trisomies than FTS, a NIPT unit cost of $665 allows a cost per trisomy case identified to be equivalent to that of FTS."

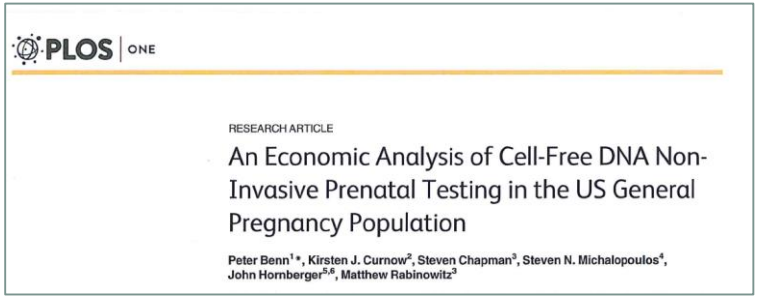
PLOS ONE

RESEARCH ARTICLE

A Cost-Effectiveness Analysis of First Trimester Non-Invasive Prenatal Screening for Fetal Trisomies in the United States

Brandon S. Walker[1], Richard E. Nelson[2], Brian R. Jackson[3], David G. Grenache[3], Edward R. Ashwood[4], Robert L. Schmidt[4]*

"Universal NIPT remained less costly than conventional MSS so long as the cost of NIPT was below $619".



PLOS ONE

RESEARCH ARTICLE

An Economic Analysis of Cell-Free DNA Non-Invasive Prenatal Testing in the US General Pregnancy Population

Peter Benn[1]*, Kirsten J. Curnow[2], Steven Chapman[3], Steven N. Michalopoulos[4], John Hornberger[5,6], Matthew Rabinowitz[3]

"Replacing conventional screening with NIPT would reduce healthcare costs if it can be provided for $744 or less in the general patient population."

Low Risk Insurance Coverage

Cell-free fetal DNA-based prenatal screening for fetal aneuploidy (trisomy 13, 18, and 21) is considered **medically necessary** when all of the following criteria are met:

1. The individual to be tested is carrying a single gestation; and

2. The individual is using this as a screening strategy for fetal aneuploidies **regardless of risk status** and understands the limitations and benefits of this screening paradigm in the context of alternative screening and diagnostic options.

NIPT and the Panorama advantage

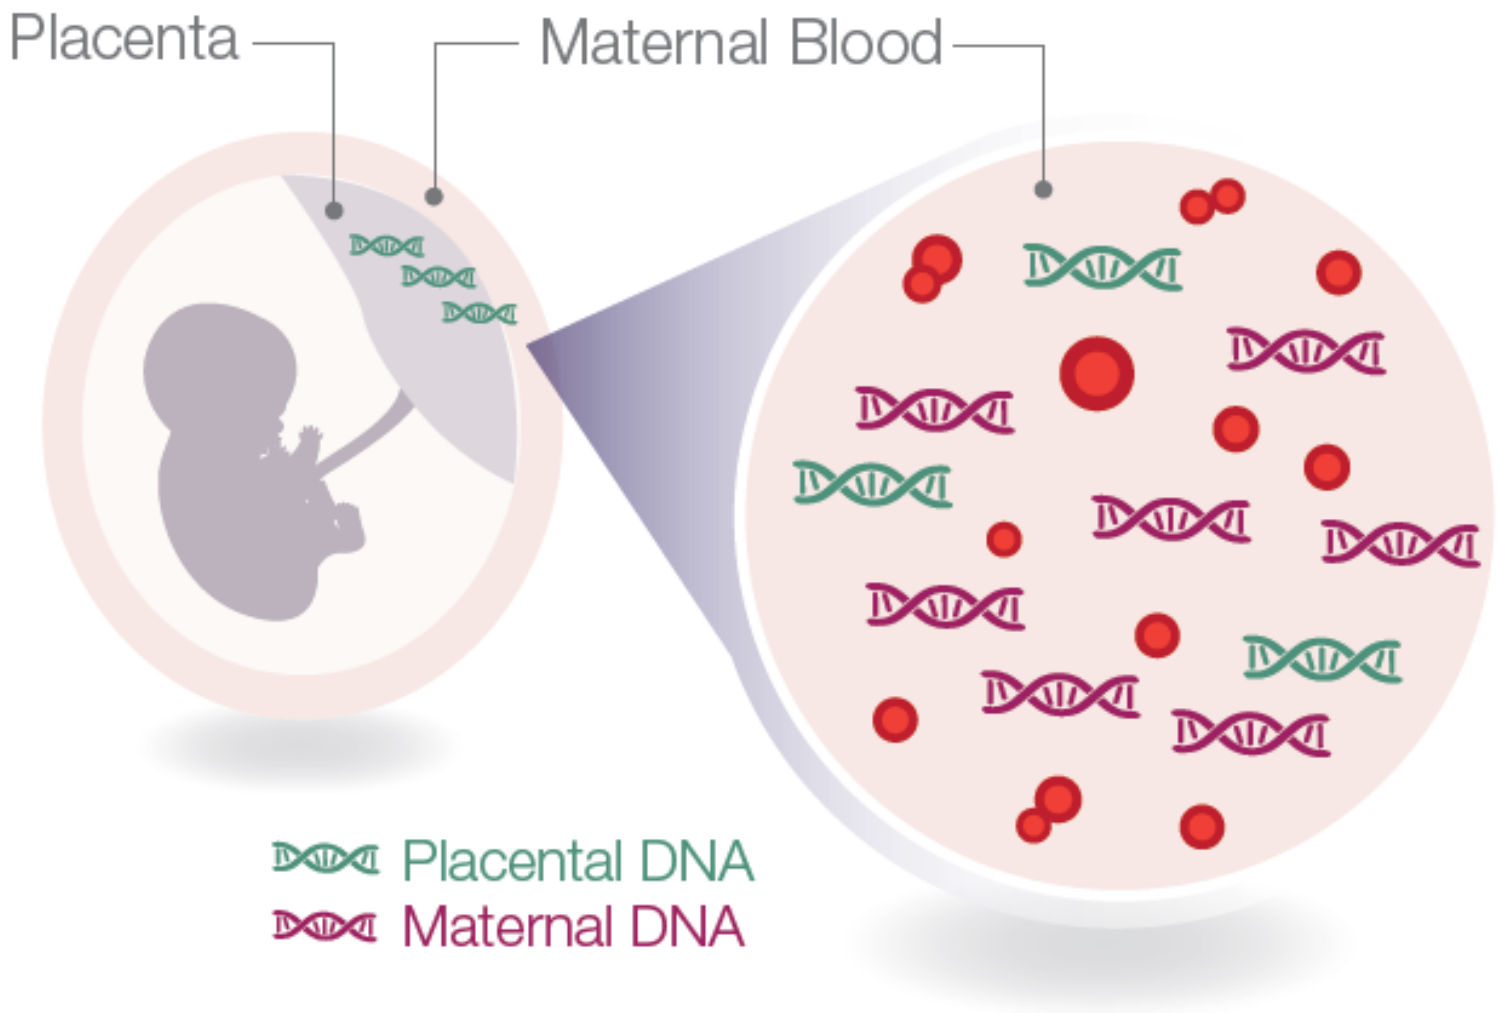
Cell-free DNA



Fetal Fraction (FF) Matters

"…the measurement of fetal cfDNA is a basic quality metric required to ensure reliable interpretation of test results."[1]

$$\frac{\text{Fetal DNA}}{\text{Fetal DNA} + \text{Maternal DNA}}$$

- Average fetal fraction is 10–12%*
- Varies by gestational age, maternal weight, placental and pregnancy factors
- Panorama® cutoff : 2.8%

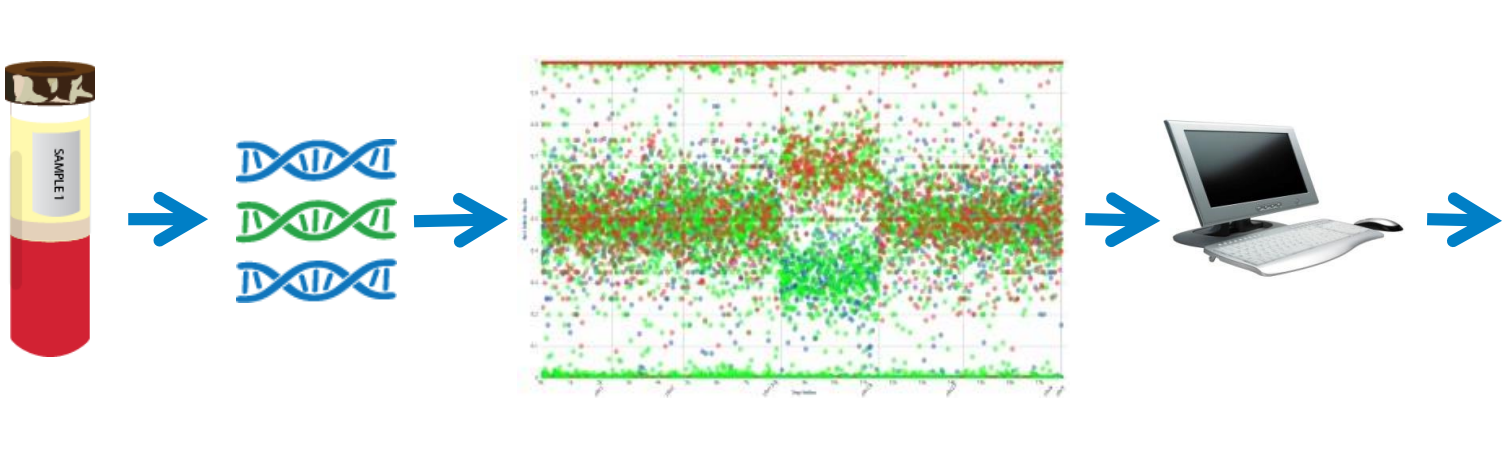
Our Technology

Proprietary SNP analysis distinguishes between maternal & fetal DNA



DNA “fingerprints”

- Panorama® is the **only** NIPT on the market that distinguishes between maternal and fetal DNA.
- Panorama® can identify different DNA “fingerprints” in a maternal blood sample, such as those from a vanishing twin.

Clinical Advantages of SNP

Panorama® uniquely differentiates between maternal and fetal DNA

- Fetal fraction
- Maternal contribution
- Vanishing twins
- Fetal sex accuracy
- Triploidy/complete mole

Clinical Advantages of SNP

Panorama® uniquely differentiates between maternal and fetal DNA

Not for Further Reproduction or Use

Case Example: False Negative NIPT

- 35 year-old G_1P_0
- 6.9mm NT at 11+ weeks
- FTS result: high risk for T21 and T18/13
- Follow up by counting NIPT: “No aneuploidy detected”
- Amnio elected after abnormal U/S: 47,XY+21
- Retrospective analysis by the NIPT laboratory:

  Fetal fraction: 1.7%

Allen R., Kezmarsky P., Lescale K., False Negative NIPT and Potential Implications for Genetic Counseling; (Abstract #47). Presented at the 2013 ACMG Annual Clinical Genetics Meeting, 03/22/2013, Phoenix, AZ

Case Example: Low Fetal Fraction

- 36 year-old
- Panorama at 10 weeks: FF<1%
- Redraw Panorama at 12 weeks: FF1.0%
- Sample sent to counting lab: normal female fetus
- Ultrasound at 18 weeks: multiple anomalies
- Amniocentesis: 69,XXX (triploidy)

Clinical Advantages of SNP

Panorama® uniquely differentiates between maternal and fetal DNA

Fetal fraction

Maternal contribution

Vanishing twins

Fetal sex accuracy

Triploidy/complete mole

Case Example: Maternal Contribution

- 38 year-old G_2P_1
- Counting NIPT “positive” for Turner syndrome
- Amniocentesis: 46,XX. Postnatal: 46, XX
- Mother's karyotype: 45,X[2], 46,XX[18]

Clinical Advantages of SNP

Panorama® uniquely differentiates between maternal and fetal DNA

Fetal fraction

Maternal contribution

Vanishing twins

Fetal sex accuracy

Triploidy/complete mole

natera™
Conceive. Deliver.

Case Example: Vanishing twin

- 35 year-old G_2P_1
- History of “vanishing twin” at 8 weeks gestation
- Panorama® at 10 weeks: “Results consistent with possible triploid or vanishing twin”
- Counting NIPT at 13 weeks: “Normal male fetus”
- Ultrasound at 17 weeks: female fetus
- Delivery: normal female, 46 XX chromosomes

Su B et al. Discordant NIPT and ultrasound results from vanishing twin pregnancy . *Contemporary Ob/GYN* April 2015.

Clinical Advantages of SNP

Panorama® uniquely differentiates between maternal and fetal DNA

Fetal fraction

Maternal contribution

Triploidy

natera™
Conceive. Deliver.

Only Panorama® Can Detect Triploidy

- 1 in 1000 pregnancies at 10 weeks[1]
- Risk for partial molar pregnancy
- Counting method cannot recognize extra copy of all chromosomes
- Provides risk assessment for couples with prior pregnancy with triploidy

natera™ Conceive. Deliver.

Case Example: Complete Molar Pregnancy

- 29 yo G_1P_0
- Panorama® at 9 weeks
- No ultrasound performed at time of blood draw
- No significant medical history
- Results show paternal isodisomic uniparental disomy (UPD)

Simon AL et al. Detection of a complete molar pregnancy by single nucleotide polymorphism-based noninvasive prenatal testing. Ultrasound Obstet Gynecol. 2015 Mar 23. doi: 10.1002/uog.14854. [Epub ahead of print]

The Panorama® Advantage

- Superior aneuploidy screening vs. maternal serum screening
- Differentiates between maternal and fetal/placental DNA
- Screening for 22q
- Available for all patients
